## On splitting theorems for CAT(0) spaces

宇都宮大学教育学部

保坂 哲也 (Tetsuya Hosaka)

The purpose of this note is to introduce main results of my recent paper [7] about splitting theorems for CAT(0) spaces.

We say that a metric space  $X$  is a *geodesic space* if for each  $x, y \in X$ , there exists an isometry  $\xi : [0, d(x, y)] \rightarrow X$  such that  $\xi(0) = x$  and  $\xi(d(x, y)) = y$  (such  $\xi$  is called a *geodesic*). Also a metric space  $X$  is said to be *proper* if every closed metric ball is compact.

Let  $X$  be a geodesic space and let  $T$  be a geodesic triangle in  $X$ . A *comparison triangle* for  $T$  is a geodesic triangle  $\bar{T}$  in the Euclidean plane  $\mathbb{R}^2$  with same edge lengths as  $T$ . Choose two points  $x$  and  $y$  in  $T$ . Let  $\bar{x}$  and  $\bar{y}$  denote the corresponding points in  $\bar{T}$ . Then the inequality

$$d(x, y) \leq d_{\mathbb{R}^2}(\bar{x}, \bar{y})$$

is called the *CAT(0)-inequality*, where  $d_{\mathbb{R}^2}$  is the natural metric on  $\mathbb{R}^2$ . A geodesic space  $X$  is called a *CAT(0) space* if the CAT(0)-inequality holds for all geodesic triangles  $T$  and for all choices of two points  $x$  and  $y$  in  $T$ .

A proper CAT(0) space  $X$  can be compactified by adding its ideal boundary  $\partial X$ , and  $X \cup \partial X$  is a metrizable compactification of  $X$  ([2], [4]).

A *geometric action* on a CAT(0) space is an action by isometries which is proper ([2, p.131]) and cocompact. We note that every CAT(0) space on which some group acts geometrically is a proper space ([2,

p.132]). Details of  $CAT(0)$  spaces and their boundaries are found in [2] and [4].

In [7], we first proved the following splitting theorem which is an extension of Proposition II.6.3 in [2].

**Theorem 1.** *Suppose that a group  $\Gamma = \Gamma_1 \times \Gamma_2$  acts geometrically on a  $CAT(0)$  space  $X$ . If  $\Gamma_1$  acts cocompactly on the convex hull  $C(\Gamma_1 x_0)$  of some  $\Gamma_1$ -orbit, then there exists a closed, convex,  $\Gamma$ -invariant, quasi-dense subspace  $X' \subset X$  such that  $X'$  splits as a product  $X_1 \times X_2$  and there exist geometric actions of  $\Gamma_1$  and  $\Gamma_2$  on  $X_1$  and  $X_2$ , respectively. Here each subspace of the form  $X_1 \times \{x_2\}$  is the closed convex hull of some  $\Gamma_1$ -orbit.*

Using this theorem, we also proved the following splitting theorem which is an extension of Theorem II.6.21 in [2].

**Theorem 2.** *Suppose that a group  $\Gamma = \Gamma_1 \times \Gamma_2$  acts geometrically on a  $CAT(0)$  space  $X$ . If the center of  $\Gamma$  is finite, then there exists a closed, convex,  $\Gamma$ -invariant, quasi-dense subspace  $X' \subset X$  such that  $X'$  splits as a product  $X_1 \times X_2$  and the action of  $\Gamma = \Gamma_1 \times \Gamma_2$  on  $X' = X_1 \times X_2$  is the product action.*

We also showed the following splitting theorem in more general case.

**Theorem 3.** *Suppose that a group  $\Gamma = \Gamma_1 \times \Gamma_2$  acts geometrically on a  $CAT(0)$  space  $X$ . Then there exist closed convex subspaces  $X_1, X_2, X'_1, X'_2$  in  $X$  such that*

- (1)  $X_1 \times X'_2$  and  $X'_1 \times X_2$  are quasi-dense subspaces of  $X$ ,
- (2)  $X'_1$  and  $X'_2$  are quasi-dense subspaces of  $X_1$  and  $X_2$  respectively,
- (3)  $\Gamma_1$  and  $\Gamma_2$  act geometrically on  $X_1$  and  $X_2$  respectively, and
- (4) some subgroups of finite index in  $\Gamma_1$  and  $\Gamma_2$  act geometrically on  $X'_1$  and  $X'_2$  respectively.

A  $CAT(0)$  space  $X$  is said to have the *geodesic extension property* if every geodesic can be extended to a geodesic line  $\mathbb{R} \rightarrow X$ . Concerning

CAT(0) spaces with the geodesic extension property, we obtained the following theorem as an application of the above splitting theorems.

**Theorem 4.** *Suppose that a group  $\Gamma = \Gamma_1 \times \Gamma_2$  acts geometrically on a CAT(0) space  $X$  with the geodesic extension property. Then  $X$  splits as a product  $X_1 \times X_2$  and there exist geometric actions of  $\Gamma_1$  and  $\Gamma_2$  on  $X_1$  and  $X_2$ , respectively. Moreover if  $\Gamma$  has finite center, then  $\Gamma$  preserves the splitting, i.e., the action of  $\Gamma = \Gamma_1 \times \Gamma_2$  on  $X = X_1 \times X_2$  is the product action.*

Let  $Y$  be a compact geodesic space of non-positive curvature. Then the universal covering  $X$  of  $Y$  is a CAT(0) space by the Cartan-Hadamard theorem (cf. [2, p.193, p.237]), and we can think of  $Y$  as the quotient  $\Gamma \backslash X$  of  $X$ , where  $\Gamma$  is the fundamental group of  $Y$  acting freely and properly by isometries on  $X$ . As an application of Theorem 2, we showed the following splitting theorem which is an extension of Corollary II.6.22 in [2].

**Theorem 5.** *Let  $Y$  be a compact geodesic space of non-positive curvature. Suppose that the fundamental group of  $Y$  splits as a product  $\Gamma = \Gamma_1 \times \Gamma_2$  and that  $\Gamma$  has trivial center. Then there exists a deformation retract  $Y'$  of  $Y$  which splits as a product  $Y_1 \times Y_2$  such that the fundamental group of  $Y_i$  is  $\Gamma_i$  for each  $i = 1, 2$ .*

A group  $\Gamma$  is called a CAT(0) group, if  $\Gamma$  acts geometrically on some CAT(0) space. Theorem 3 implies the following.

**Theorem 6.**  *$\Gamma_1$  and  $\Gamma_2$  are CAT(0) groups if and only if  $\Gamma_1 \times \Gamma_2$  is a CAT(0) group.*

In [3], Croke and Kleiner proved that there exists a CAT(0) group  $\Gamma$  and CAT(0) spaces  $X$  and  $Y$  such that  $\Gamma$  acts geometrically on  $X$  and  $Y$  and the boundaries of  $X$  and  $Y$  are not homeomorphic. A CAT(0) group  $\Gamma$  is said to be *rigid*, if  $\Gamma$  determines the boundary up to homeomorphism of a CAT(0) space on which  $\Gamma$  acts geometrically. Then we denote  $\partial\Gamma$  as the boundary of the rigid CAT(0) group  $\Gamma$ .

A conclusion in [1] implies that if  $\Gamma$  is a rigid  $\text{CAT}(0)$  group, then  $\Gamma \times \mathbb{Z}^n$  is also a rigid  $\text{CAT}(0)$  group for each  $n \in \mathbb{N}$ . In [9], Ruane proved that if  $\Gamma_1 \times \Gamma_2$  is a  $\text{CAT}(0)$  group and if  $\Gamma_1$  and  $\Gamma_2$  are hyperbolic groups (in the sense of Gromov) then  $\Gamma_1 \times \Gamma_2$  is rigid. Concerning rigidity of products of rigid  $\text{CAT}(0)$  groups, we can obtain the following theorem from Theorem 3 which is an extension of these results.

**Theorem 7.** *If  $\Gamma_1$  and  $\Gamma_2$  are rigid  $\text{CAT}(0)$  groups, then so is  $\Gamma_1 \times \Gamma_2$ , and the boundary  $\partial(\Gamma_1 \times \Gamma_2)$  is homeomorphic to the join  $\partial\Gamma_1 * \partial\Gamma_2$  of the boundaries of  $\Gamma_1$  and  $\Gamma_2$ .*
